For patients with colorectal cancer (CRC), laparoscopic colectomy (LC) is associated with shorter hospital stay (HS) and a faster recovery than open colectomy (OC). However, the long-term results of LC compared to OC are unclear. The aim of the present study was to compare the long-term outcome after LC versus OC in a nationwide cohort of patients. The study used data from the Danish Colorectal Cancer Group (DCCG) registry, which was combined with the Danish civil registration system and the Danish Cancer Registry (CCR). From 2002 to 2013, a total of 1482 patients underwent surgery for CRC in Denmark. Of these patients, 1580 (1086 LC and 494 OC) had complete follow-up data. The median follow-up time was 10 years. The primary outcome measures were overall survival (OS), disease-specific survival (DSS) and HS. The median age was 69 years (range: 20-94). The median OS was 15.9 years (range: 5.6-30.1) for LC and 12.7 years (range: 4.0-23.1) for OC (HR 1.15, 95% CI 0.97-1.35, p = 0.105). The median DSS was 12.4 years (range: 2.1-23.6) and 7.8 years (range: 0.0-16.1), respectively (HR 0.87, 95% CI 0.69-1.09, p = 0.220). The median HS for LC was 6.2 days (range: 1-9) versus 5.0 days (range: 0-14) for OC (p Q: How to get data from 82157476af
